THE VANGUARD INVESTING COMPANY

**50 years of changing the way the world
invests**

From the revolutionary idea of low-cost investments that started it all, to the historic reduction expected to save investors \$350 million, customers will always be our why.

THE DIGITAL CHALLENGE

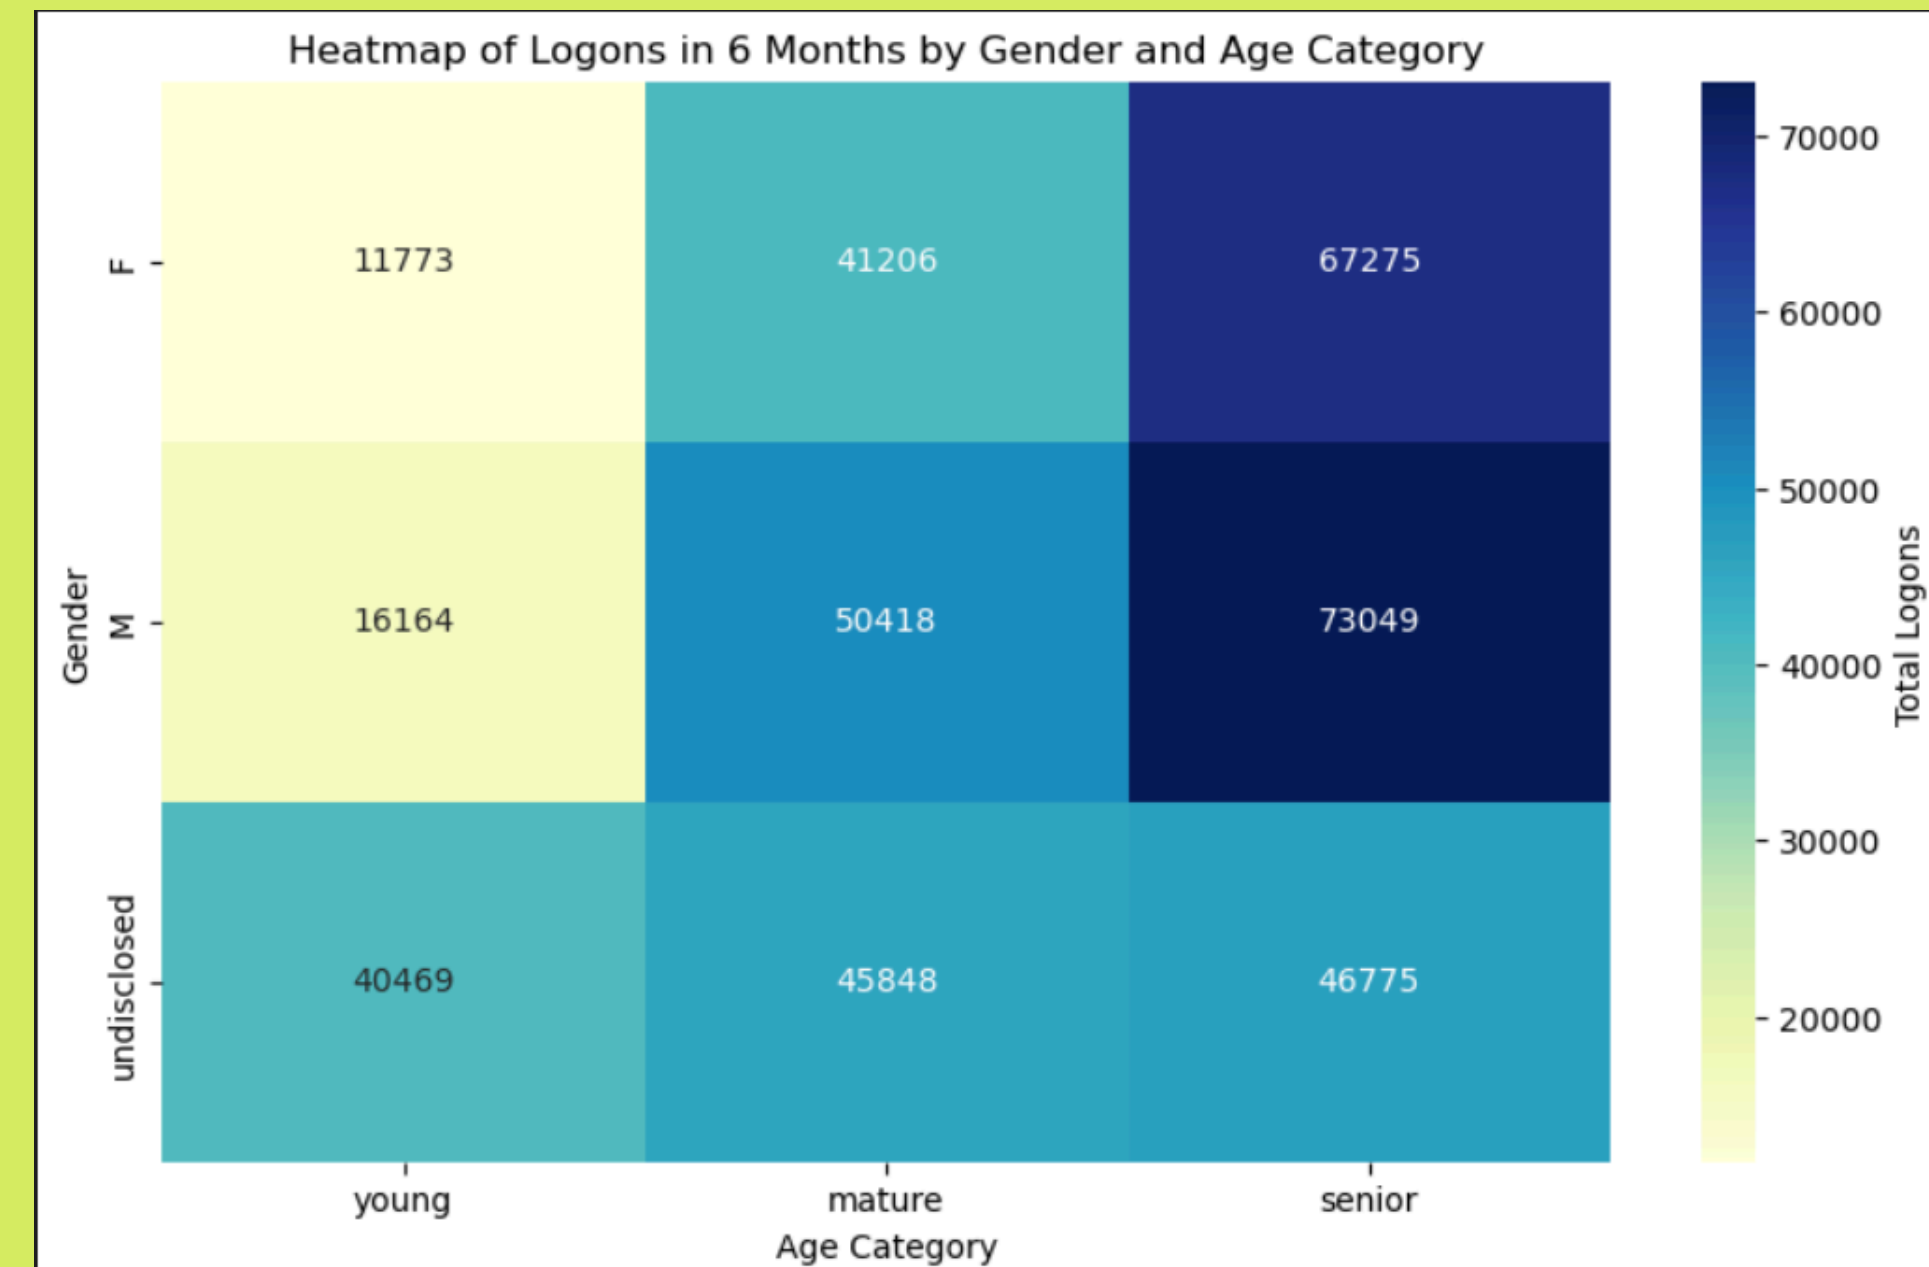

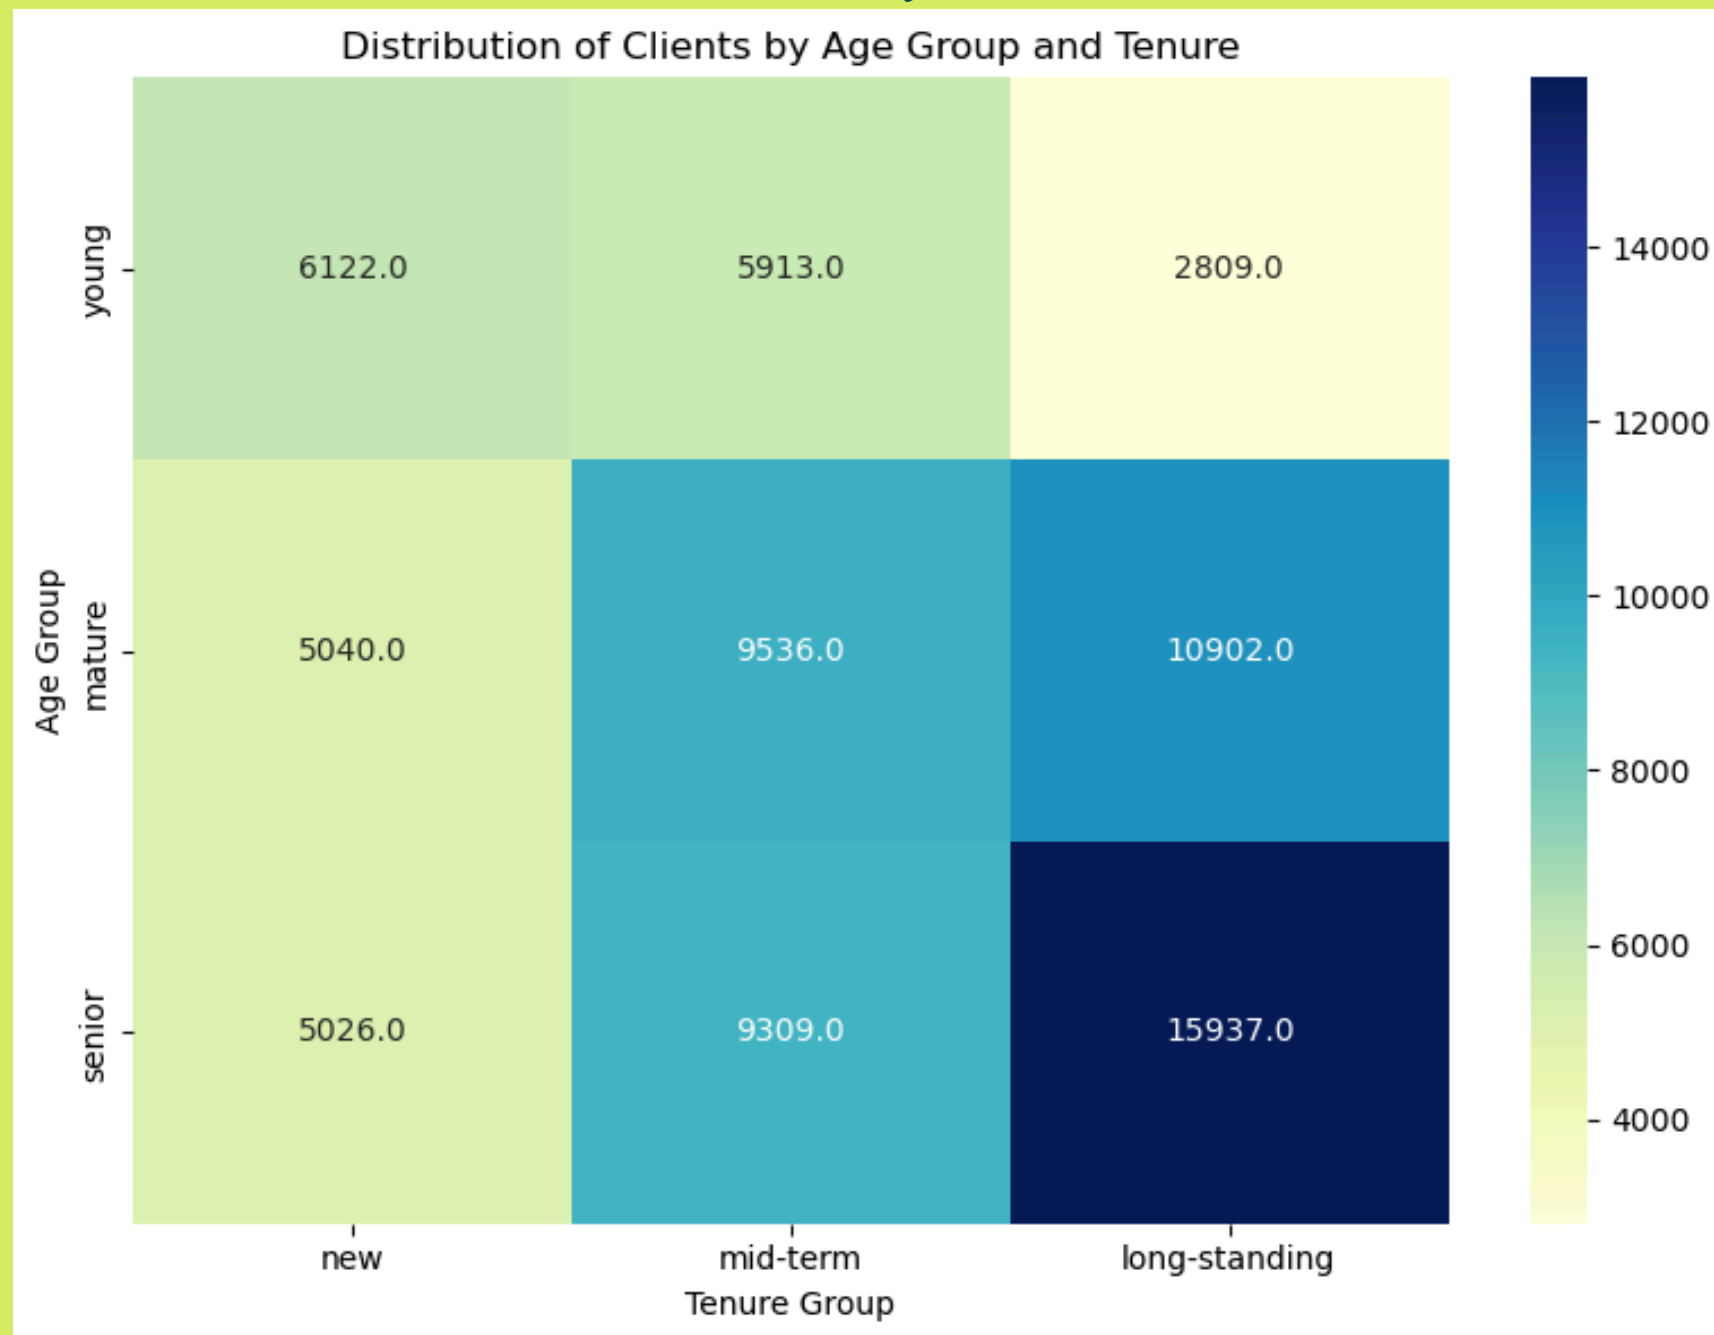

With evolving digital world, we as a company believed that a more intuitive and modern User Interface (UI), coupled with timely in-context prompts (cues, messages, hints, or instructions), could make the online process smoother for clients.

but....

WOULD THESE CHANGES ENCOURAGE MORE CLIENTS TO
COMPLETE THE PROCESS?

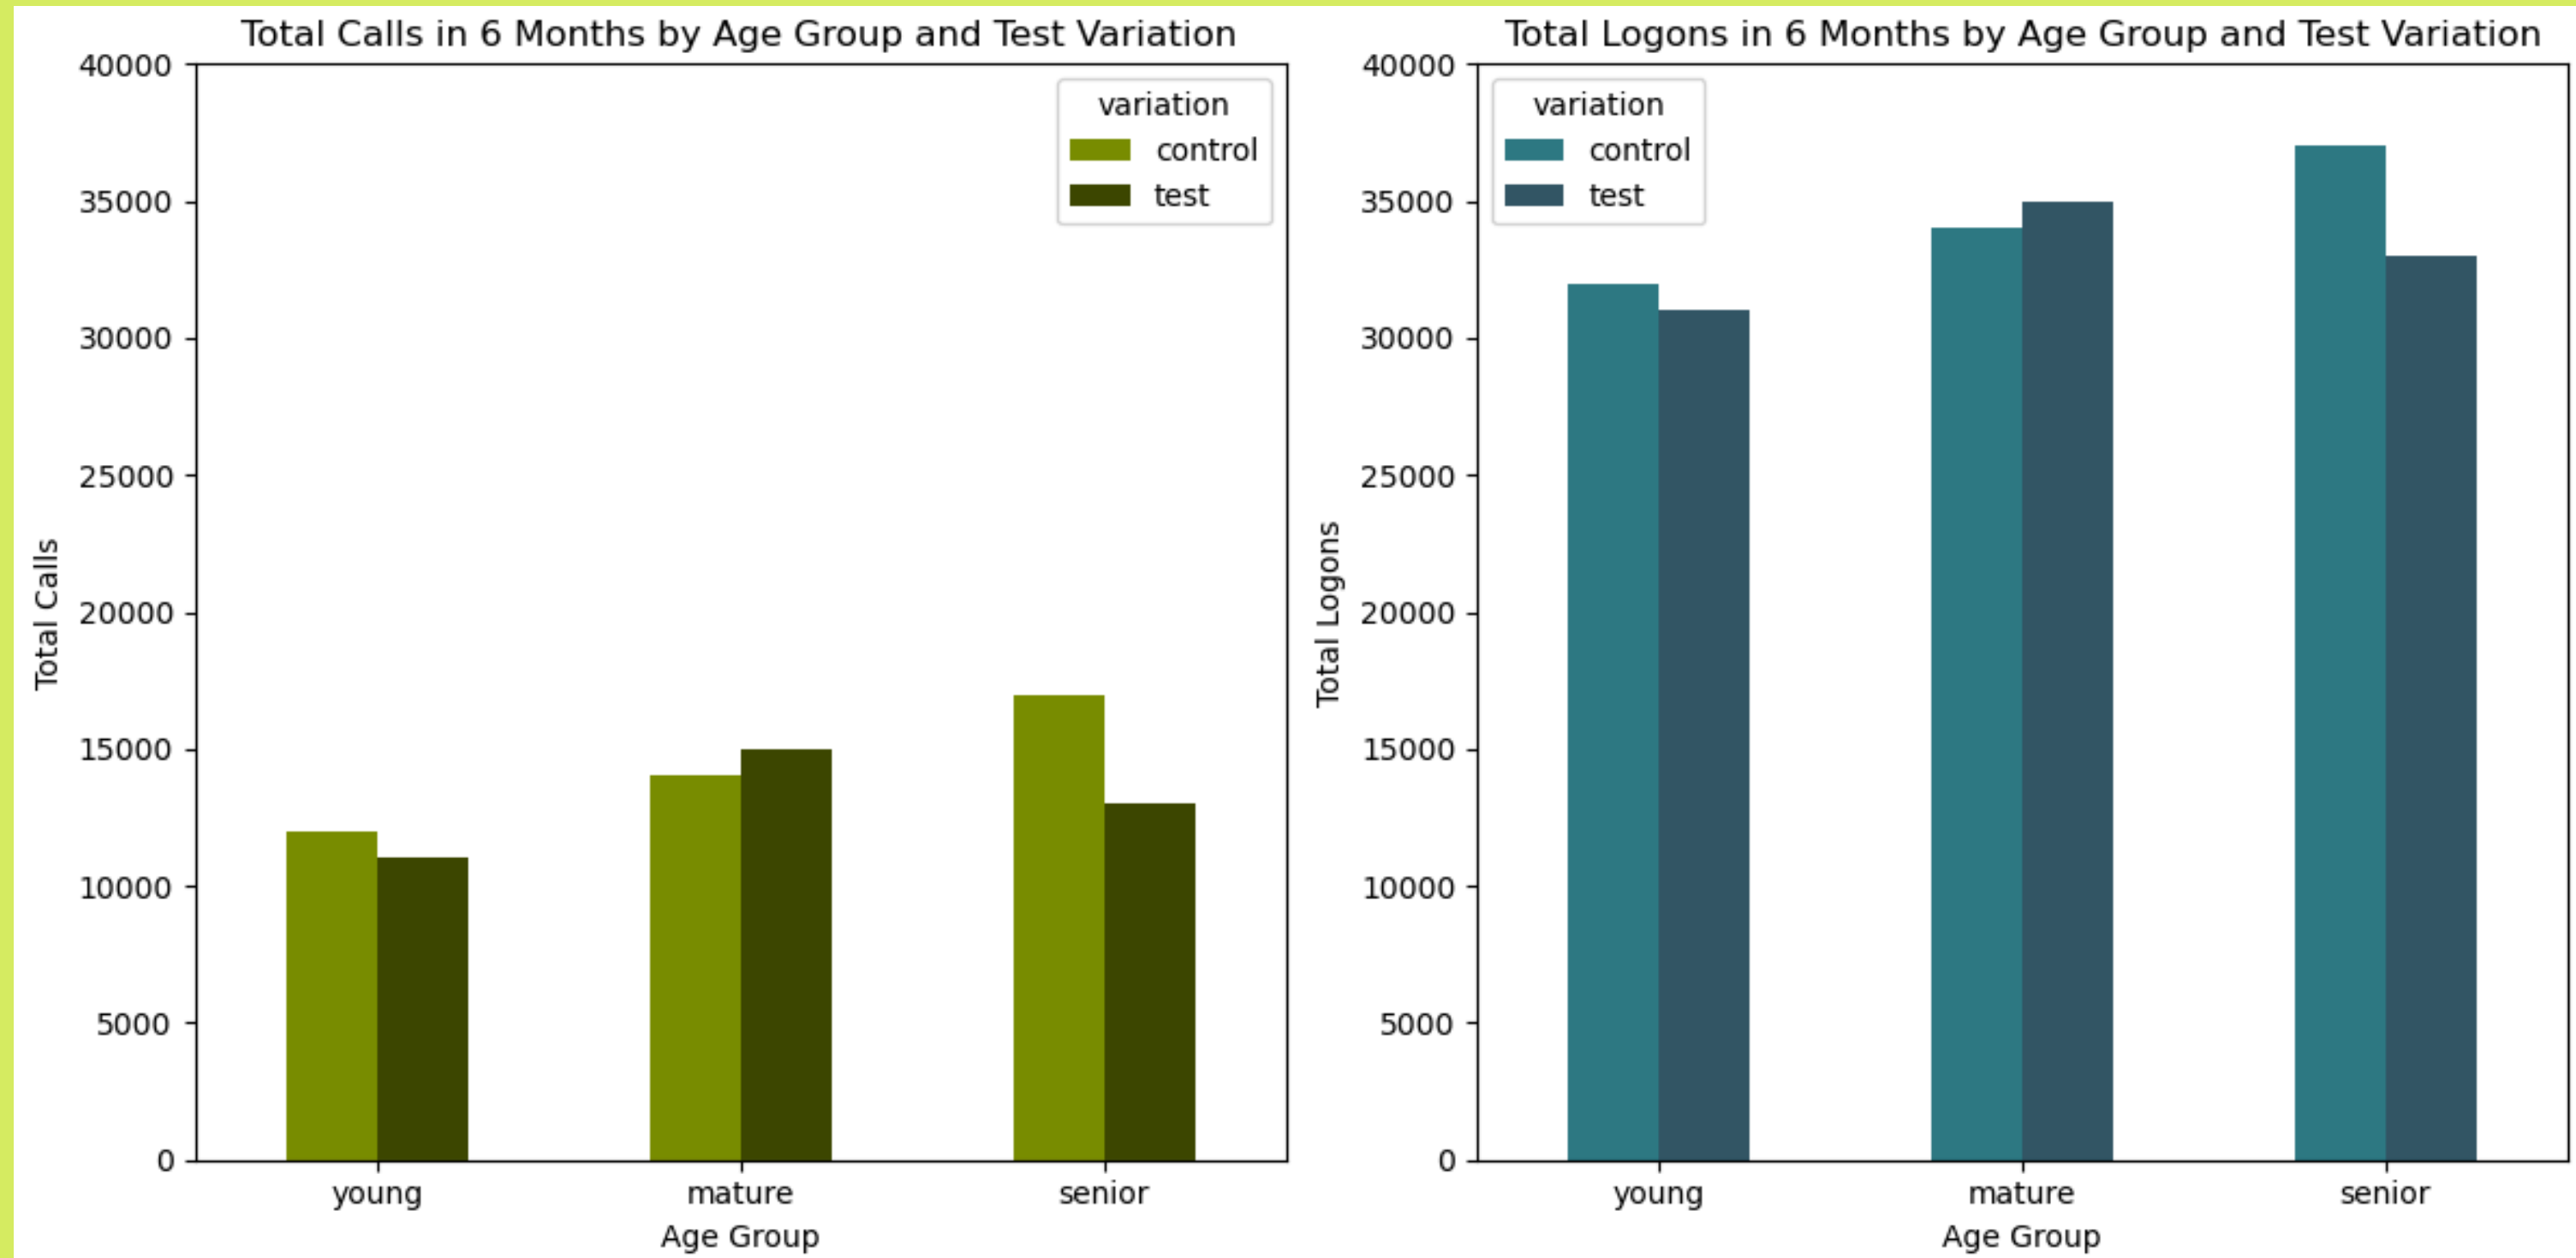

WHO ARE THE MAIN CLIENTS USING VANGUARD'S ONLINE PROCESS?

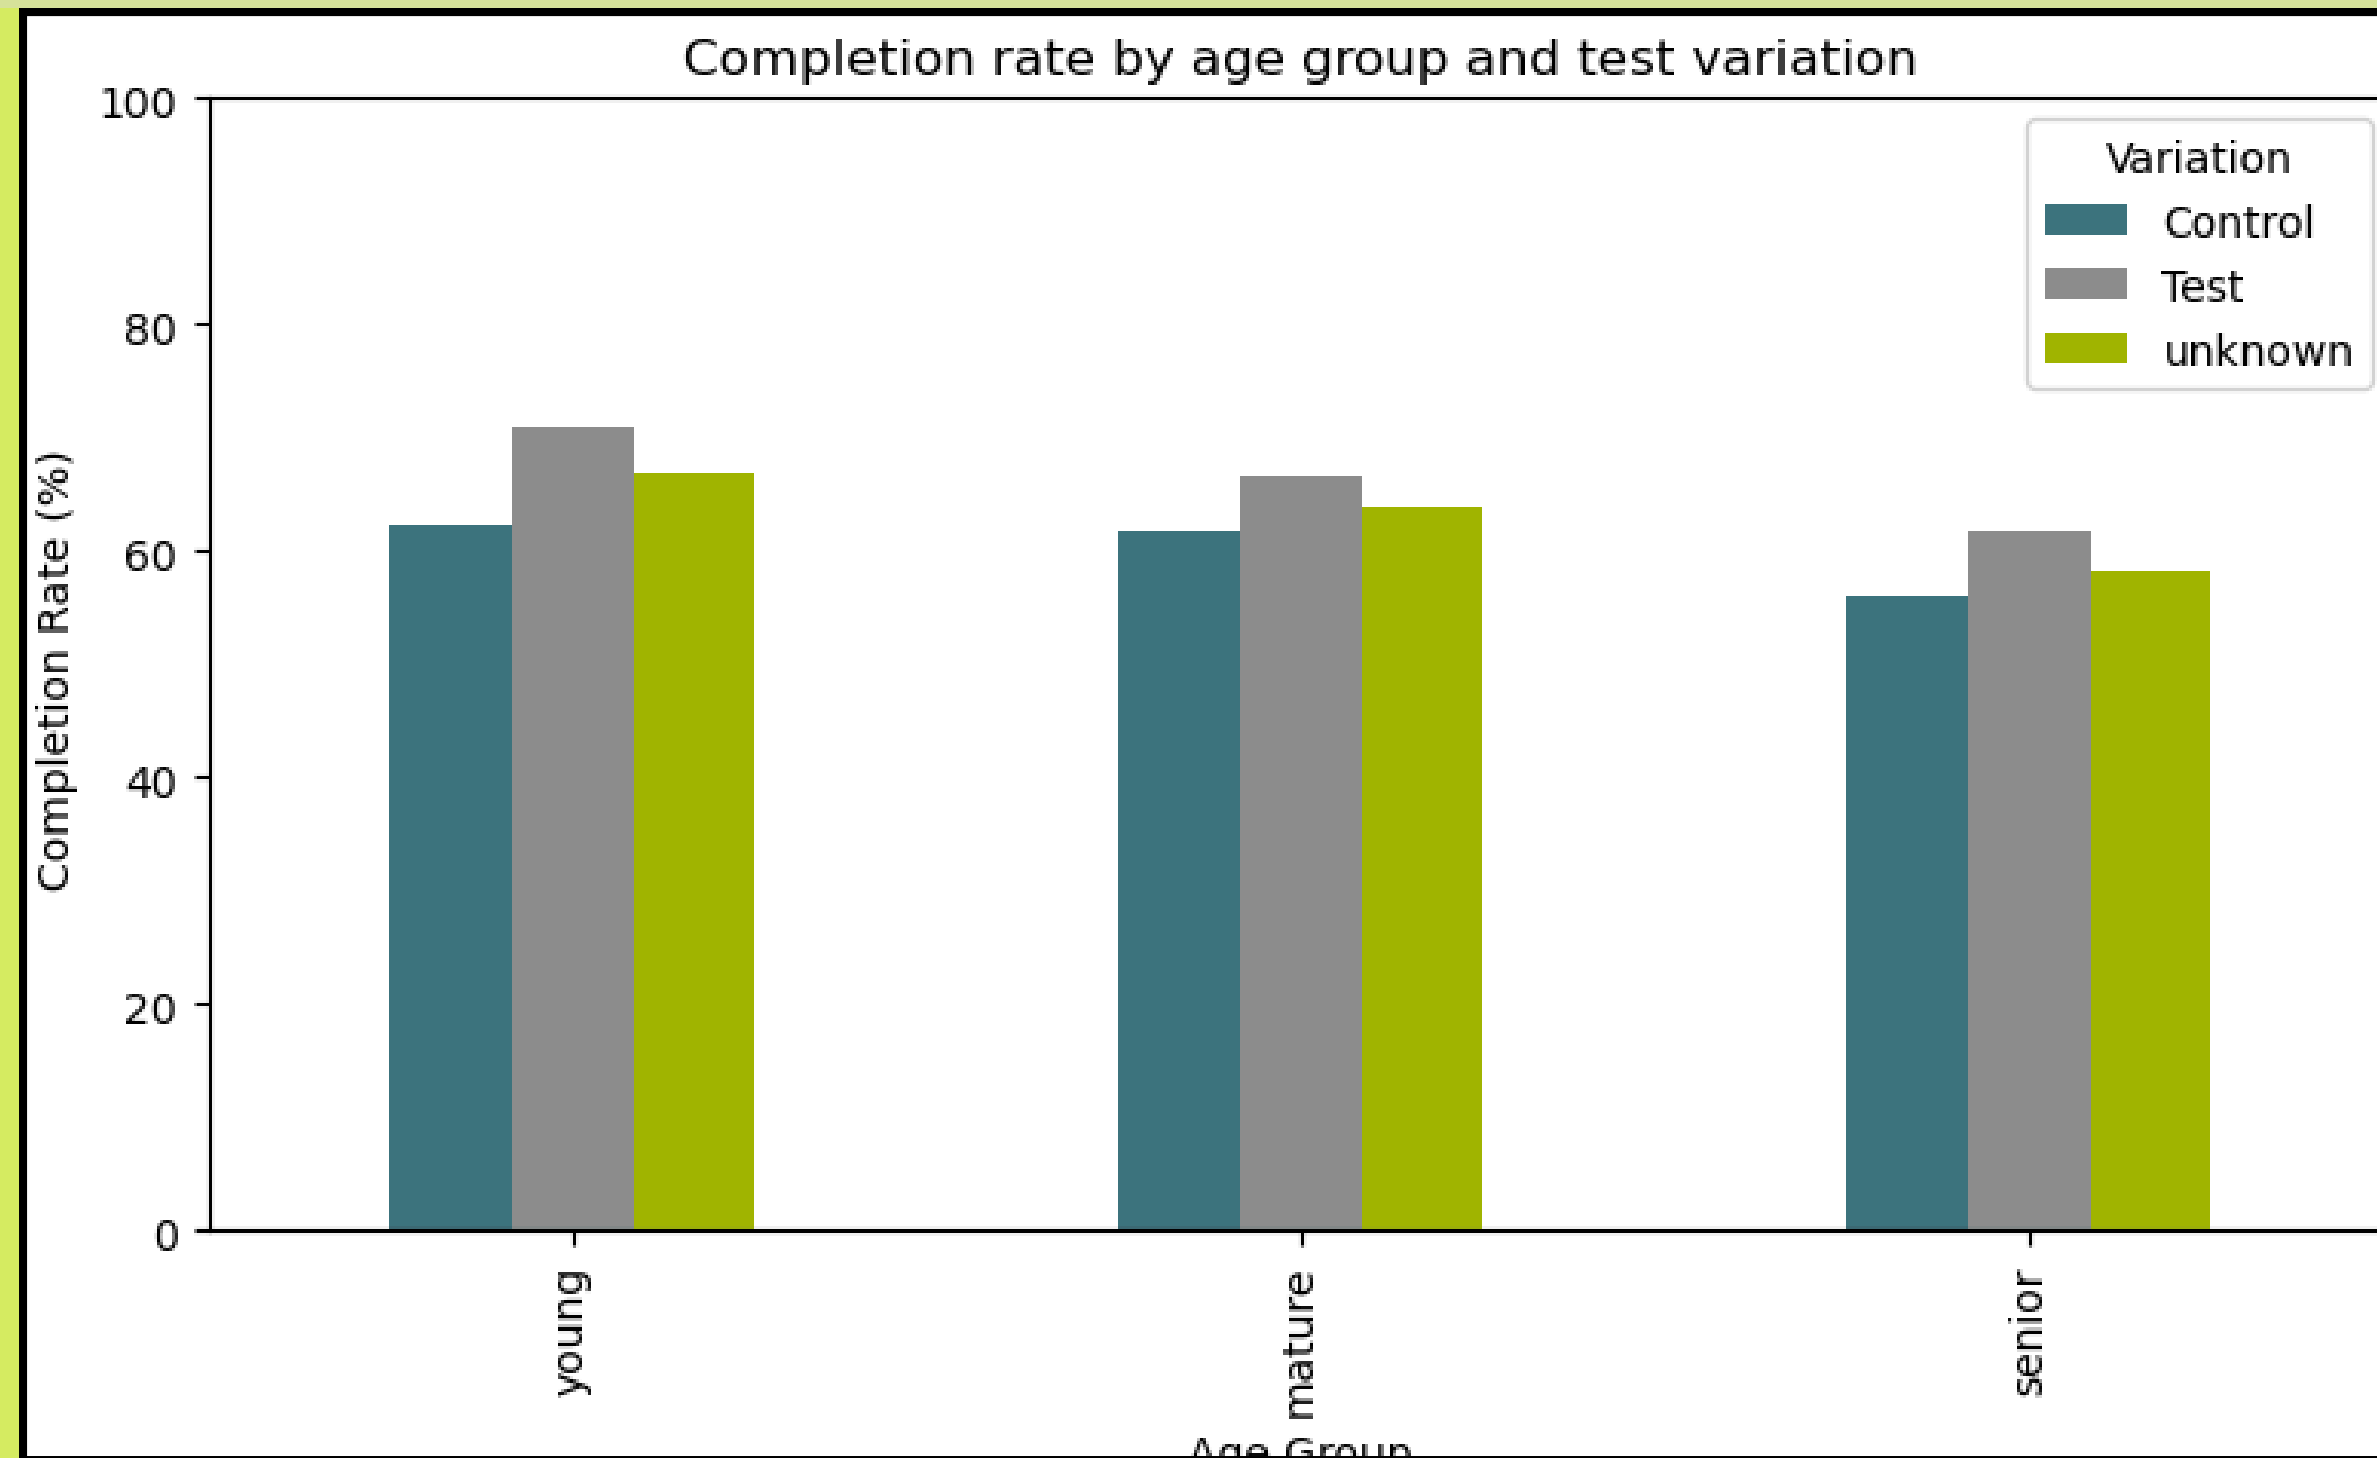

HOW CLIENTS PREFER TO CONTACT THE COMPANY?

Customers that completed the process are predominantly from a younger age group!

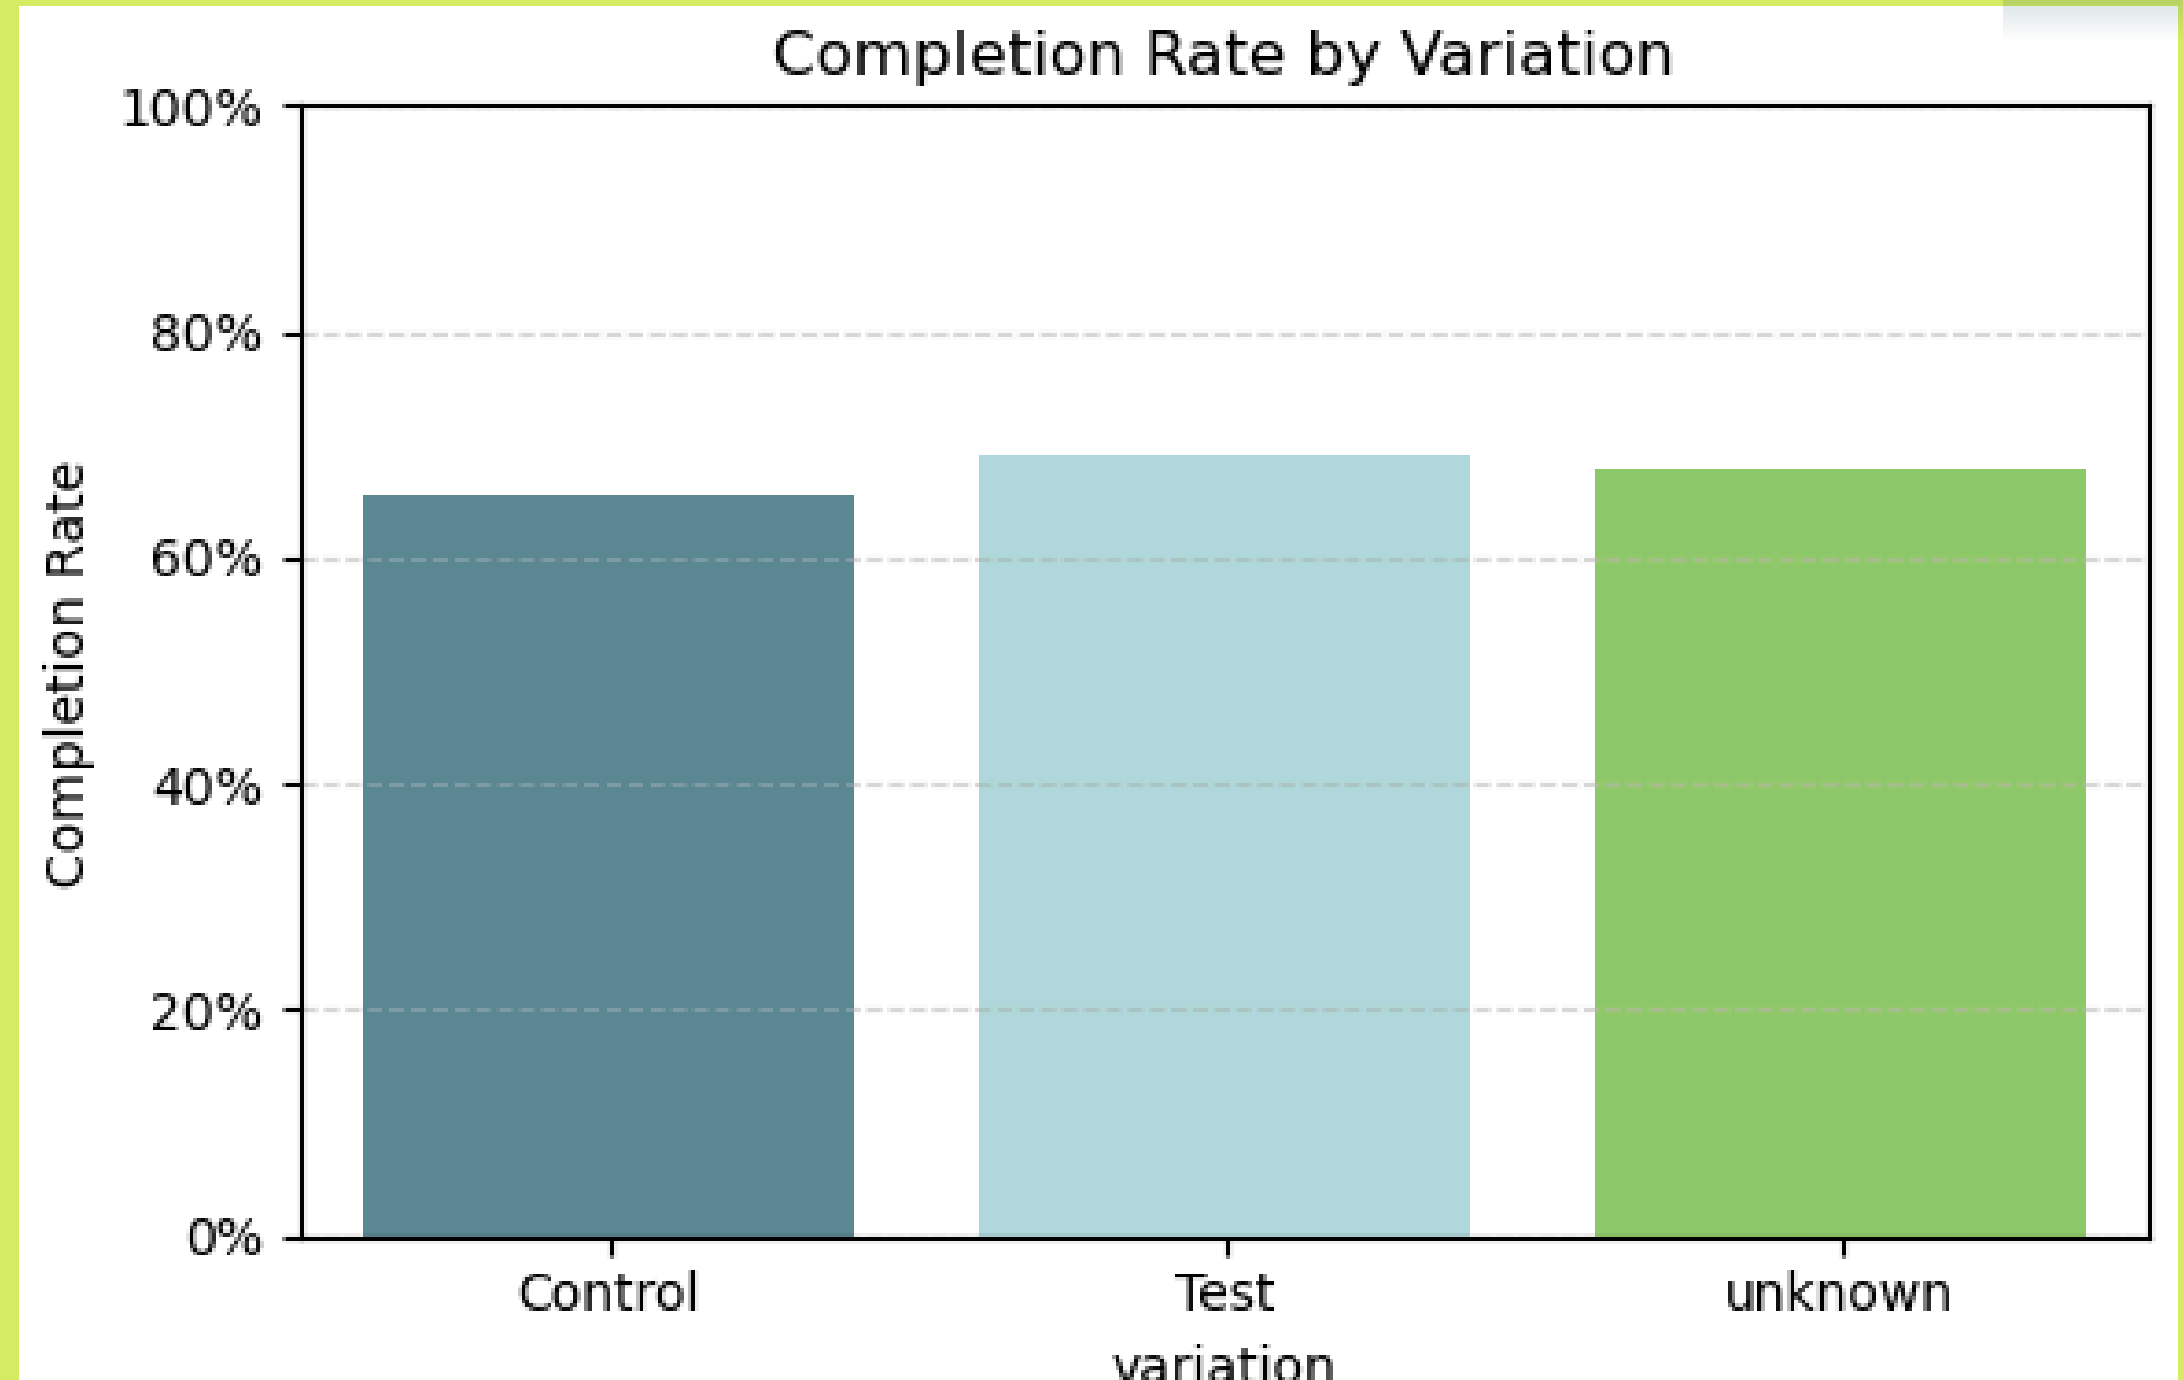

KPIs

COMPLETION RATE

Test group has the highest completion rate (around 69%) and Control with the lowest (around 66%). This suggests the Test variation may perform slightly better in encouraging completion.

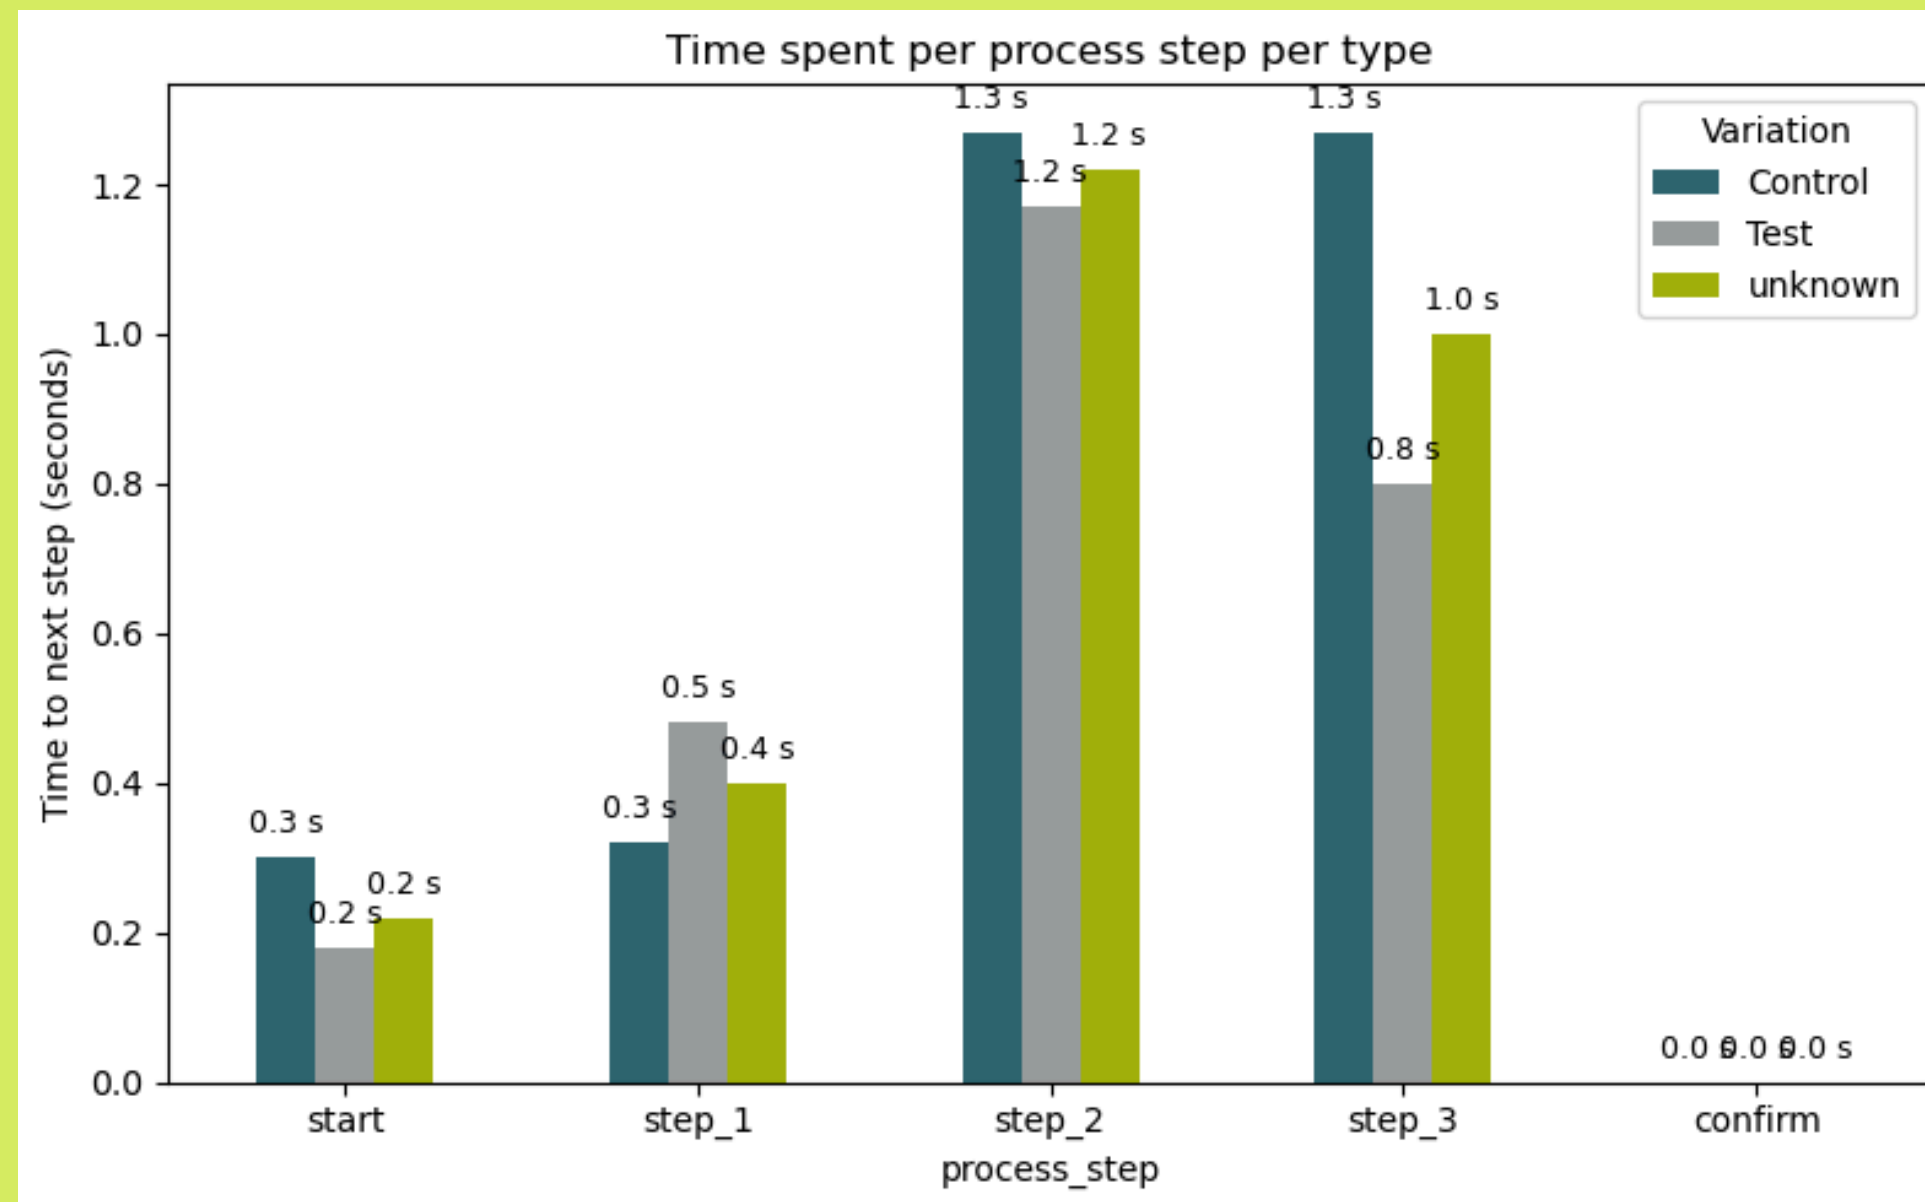

KPIs

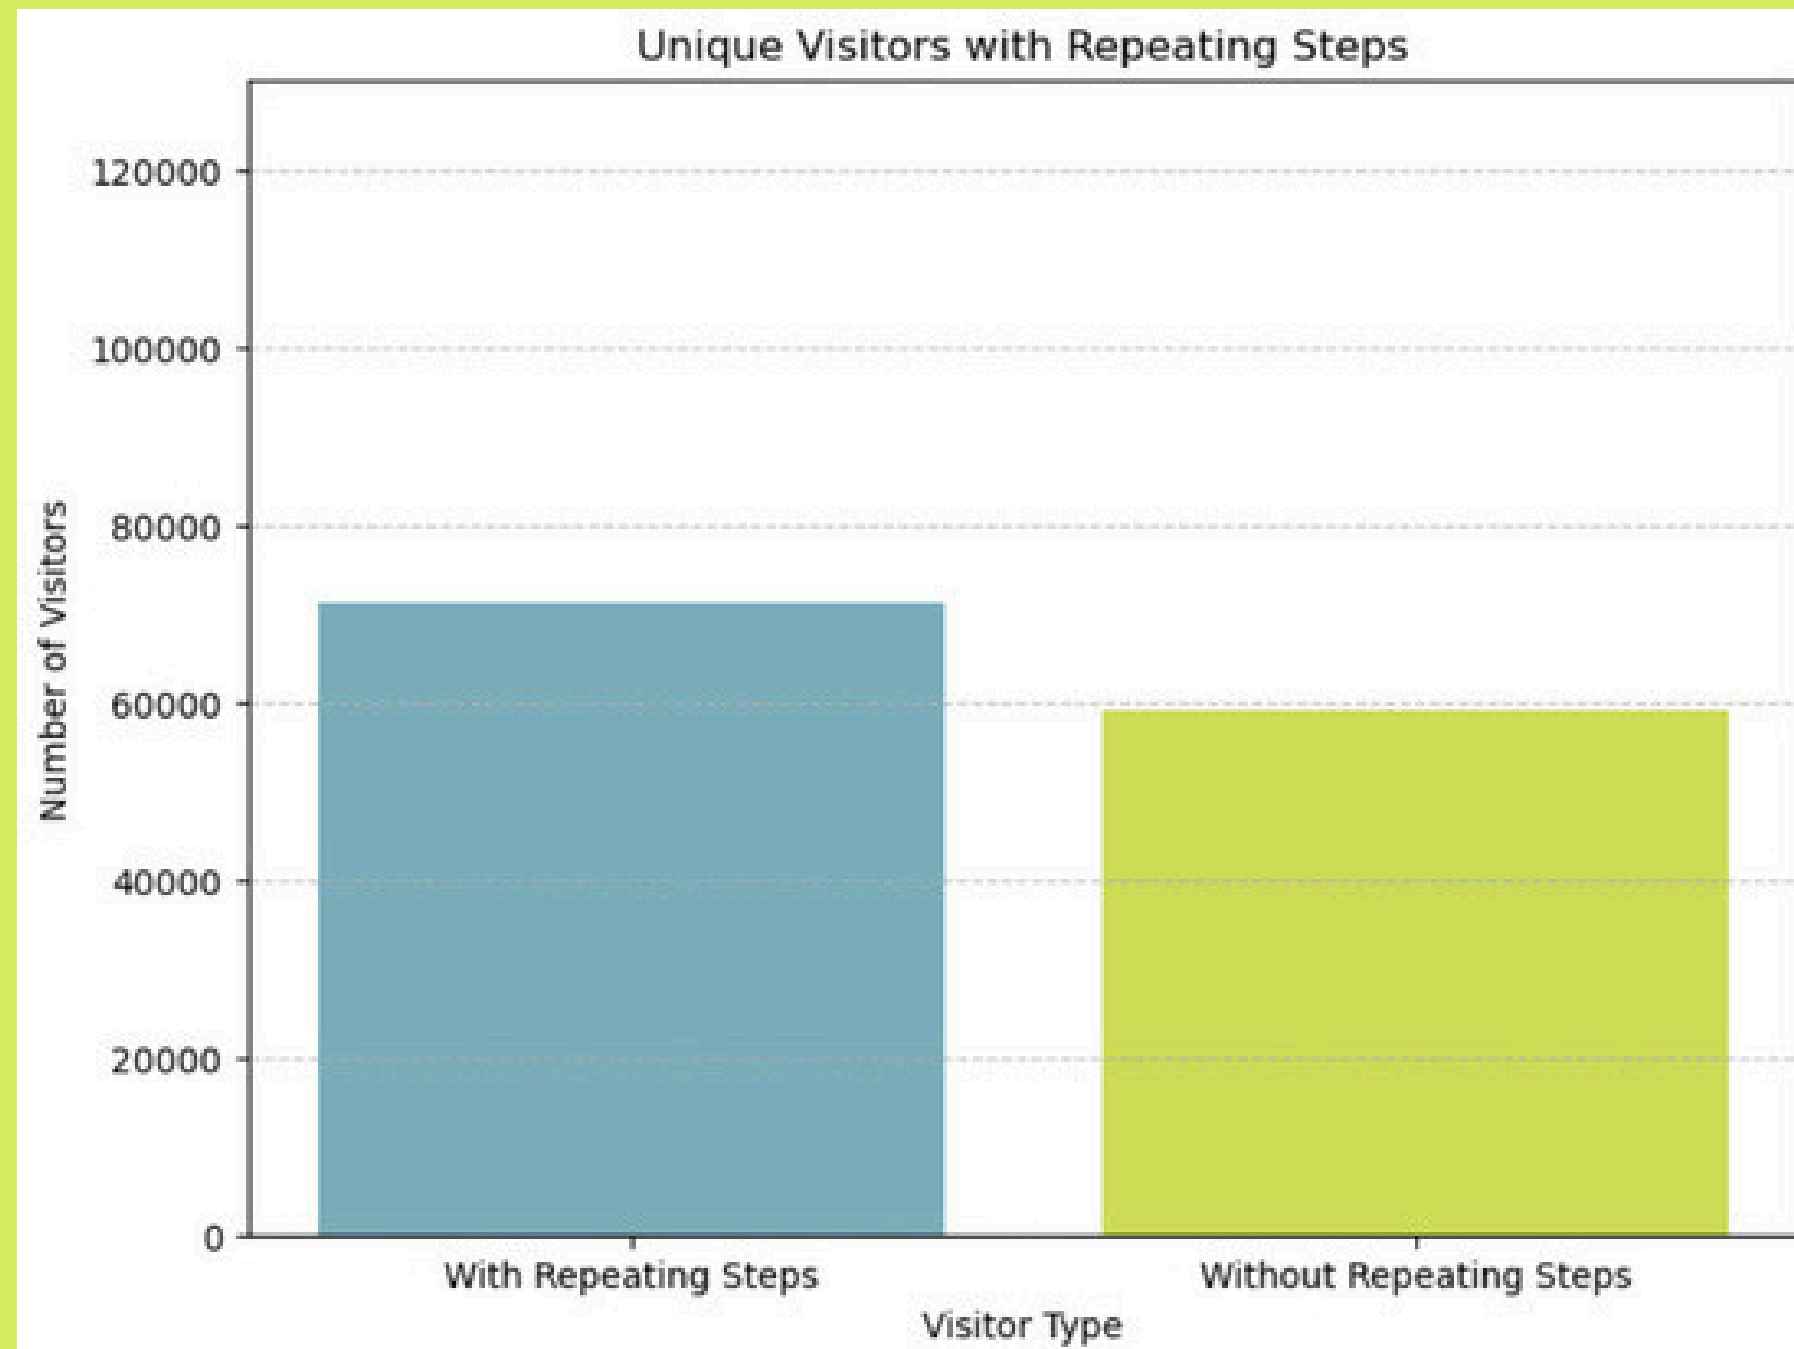

TIME SPENT ON EACH STEP

Step 2 recorded the highest average time spent by users in both the Test and Control groups, suggesting it may be the step with the greatest complexity or user friction.

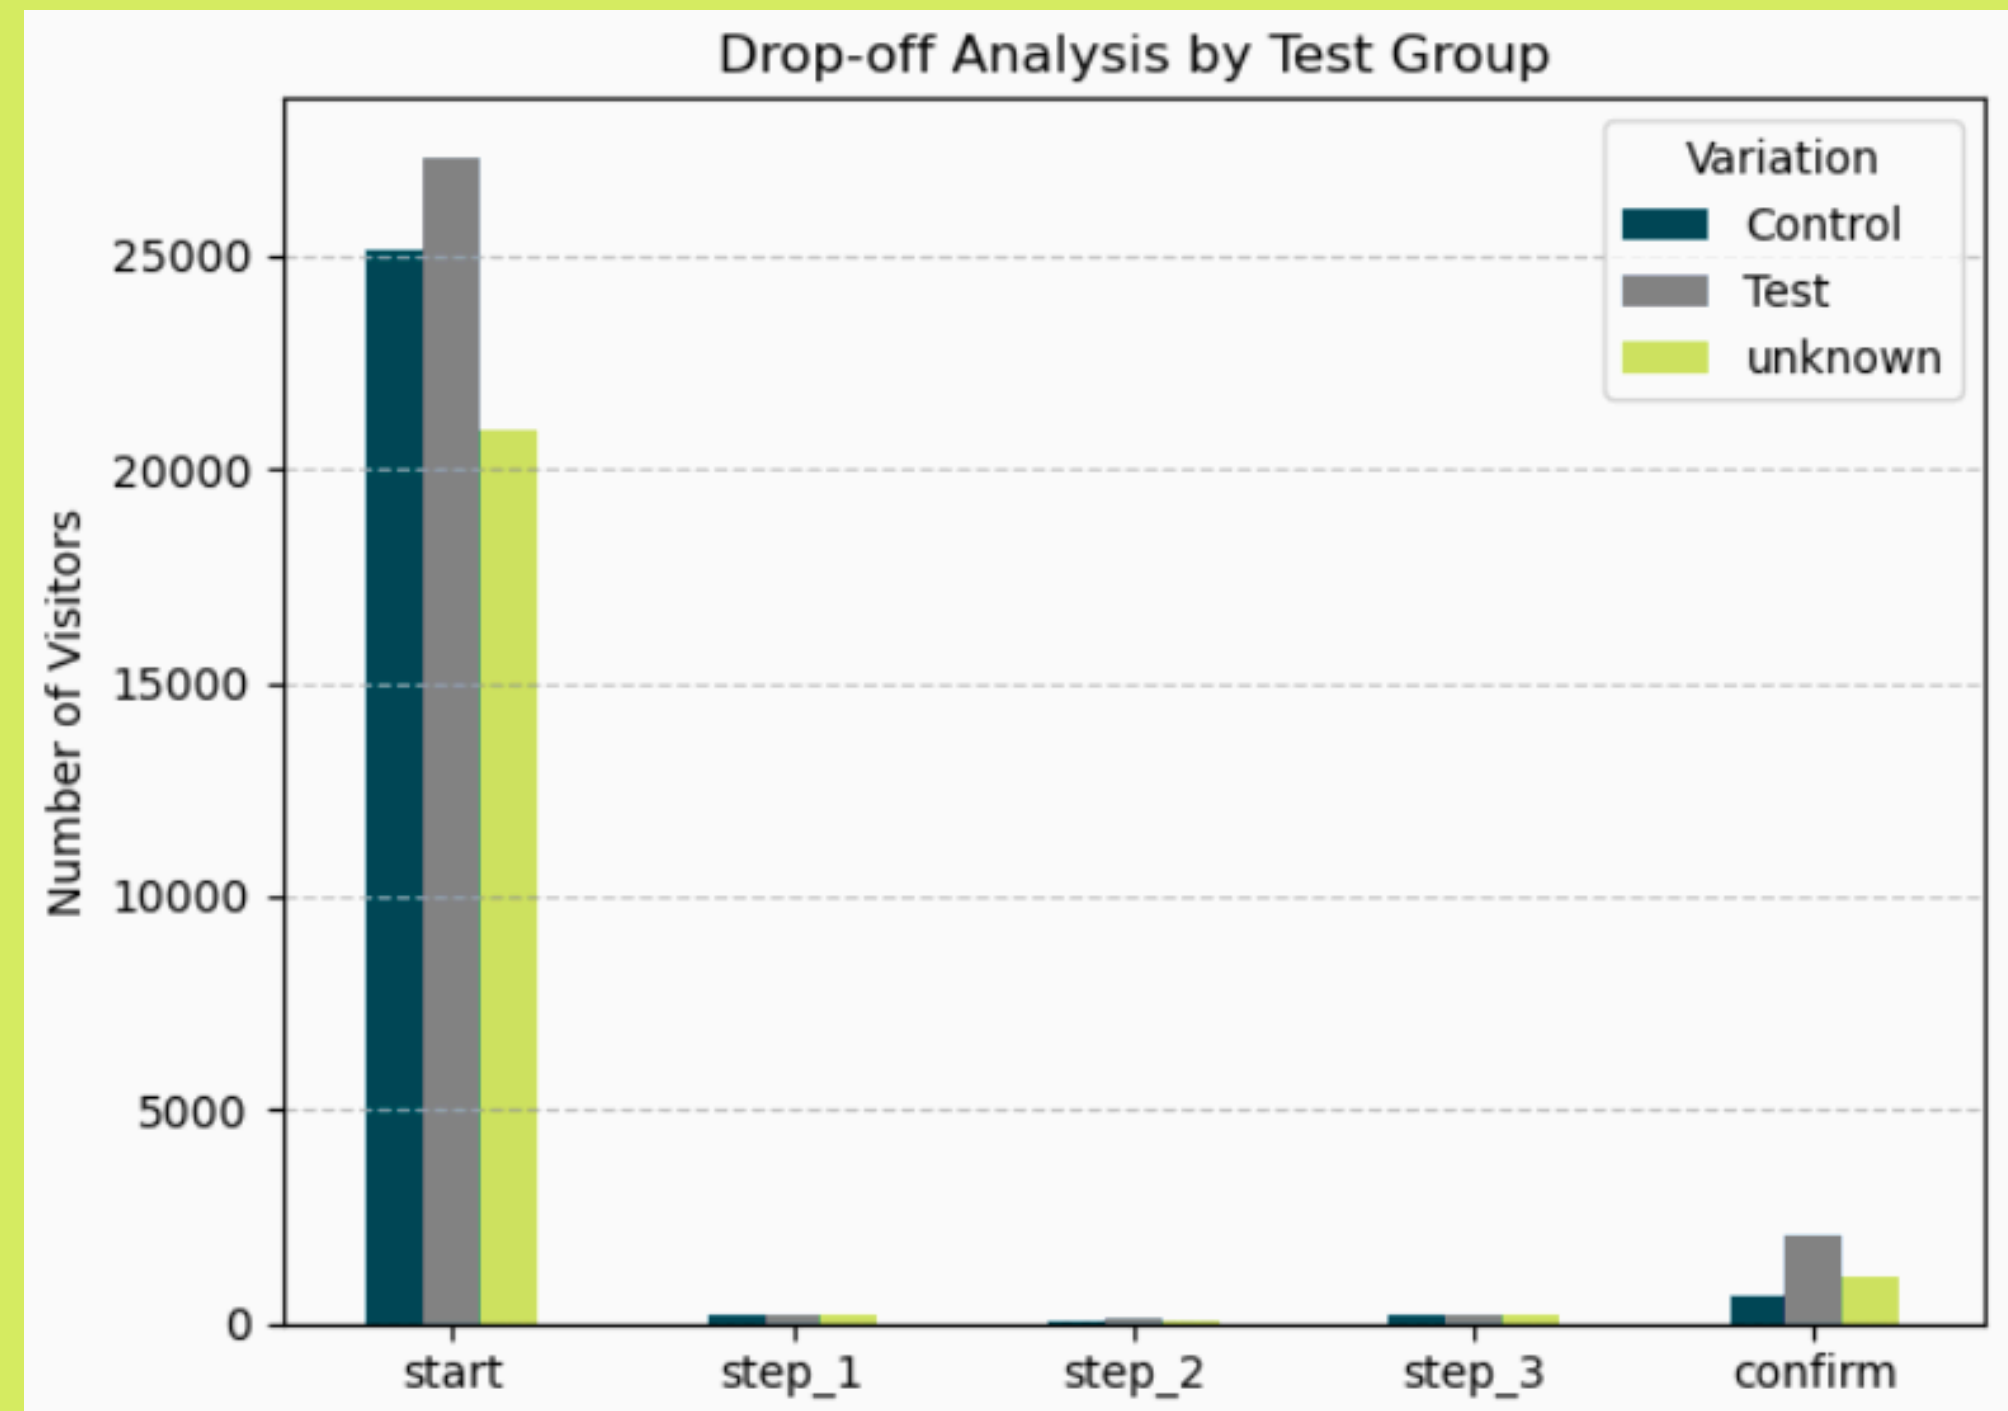

ERROR RATES

Number of repeating steps is 71 152 which show's that visitors might have experienced Errors while doing the process.

ERROR RATES

Most of the users drop off at the start step, and mostly from B group which was the test group.

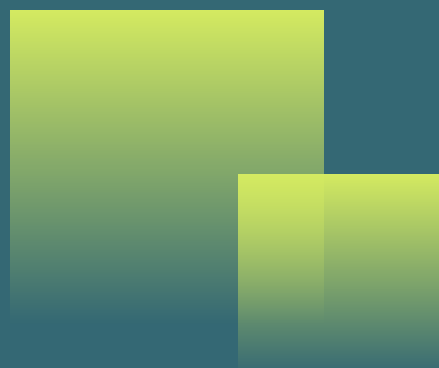

CHECKPOINTS WE USED TO FIND OUT IF NEW UI LEAD TO HIGHER COMPLETION RATES!

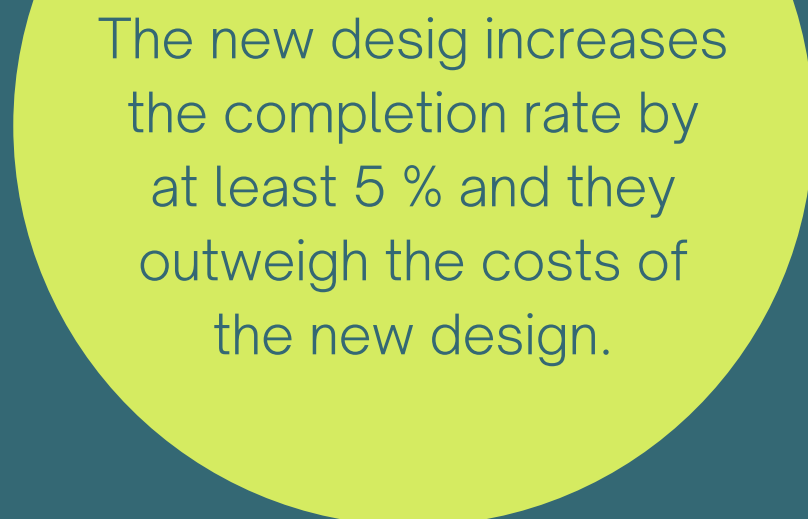

COMPLETION RATE

The new design likely improves user completion behavior.

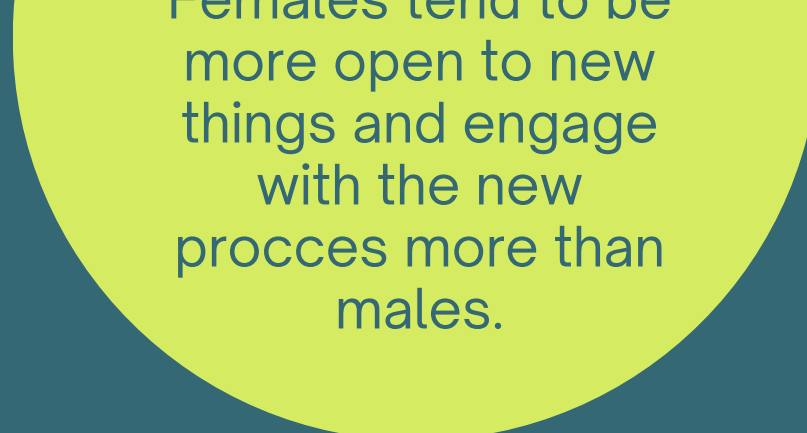

COST- EFFECTIVENESS THRESHOLD

The new design increases the completion rate by at least 5 % and they outweigh the costs of the new design.

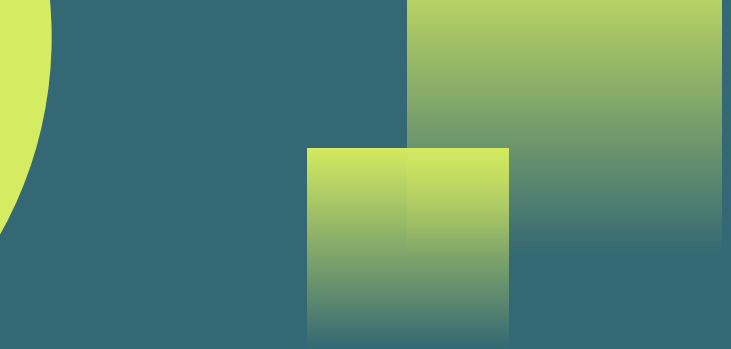

GENDER DIFFERENCES

Females tend to be more open to new things and engage with the new process more than males.

YOUNG VS SENIOR CLIENTS

Young clients are significantly more likely to complete the process

IS IT WORTH IT TO INVEST IN THIS CHANGE?

COMPLETION RATE

Hypothesis Testing Results:

Z-statistic: 14.538

P-value: 3.49e-48 (<0.05)

Reject the null hypothesis: the increase in completion rate for the Test group is statistically significant.

The new design likely improves user completion behavior.

COST-EFFECTIVENESS THRESHOLD

Hypothesis Testing Results:

Z-statistic: -22.6181

P-value: 1.0000 (>0.05)

Fail to reject the null hypothesis: There's insufficient evidence that the new design increases the completion rate by at least 5%.

GENDER DIFFERENCES

Hypothesis Testing Results:

Z-statistic: 0.4066

P-value: 0.3422 (>0.05)

Fail to reject the null hypothesis: Females are not more engaged with the new process than males.

YOUNG CLIENTS

Hypothesis Testing Results:

Z-statistic: 9.279

P-value: 8.519e-21 (< 0.05)

Reject the null hypothesis: young clients are more likely to complete the process when exposed to the new solution (Test group) compared to the old one (Control group)

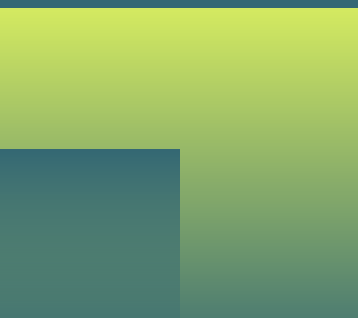

EXPERIMENT EVALUATION

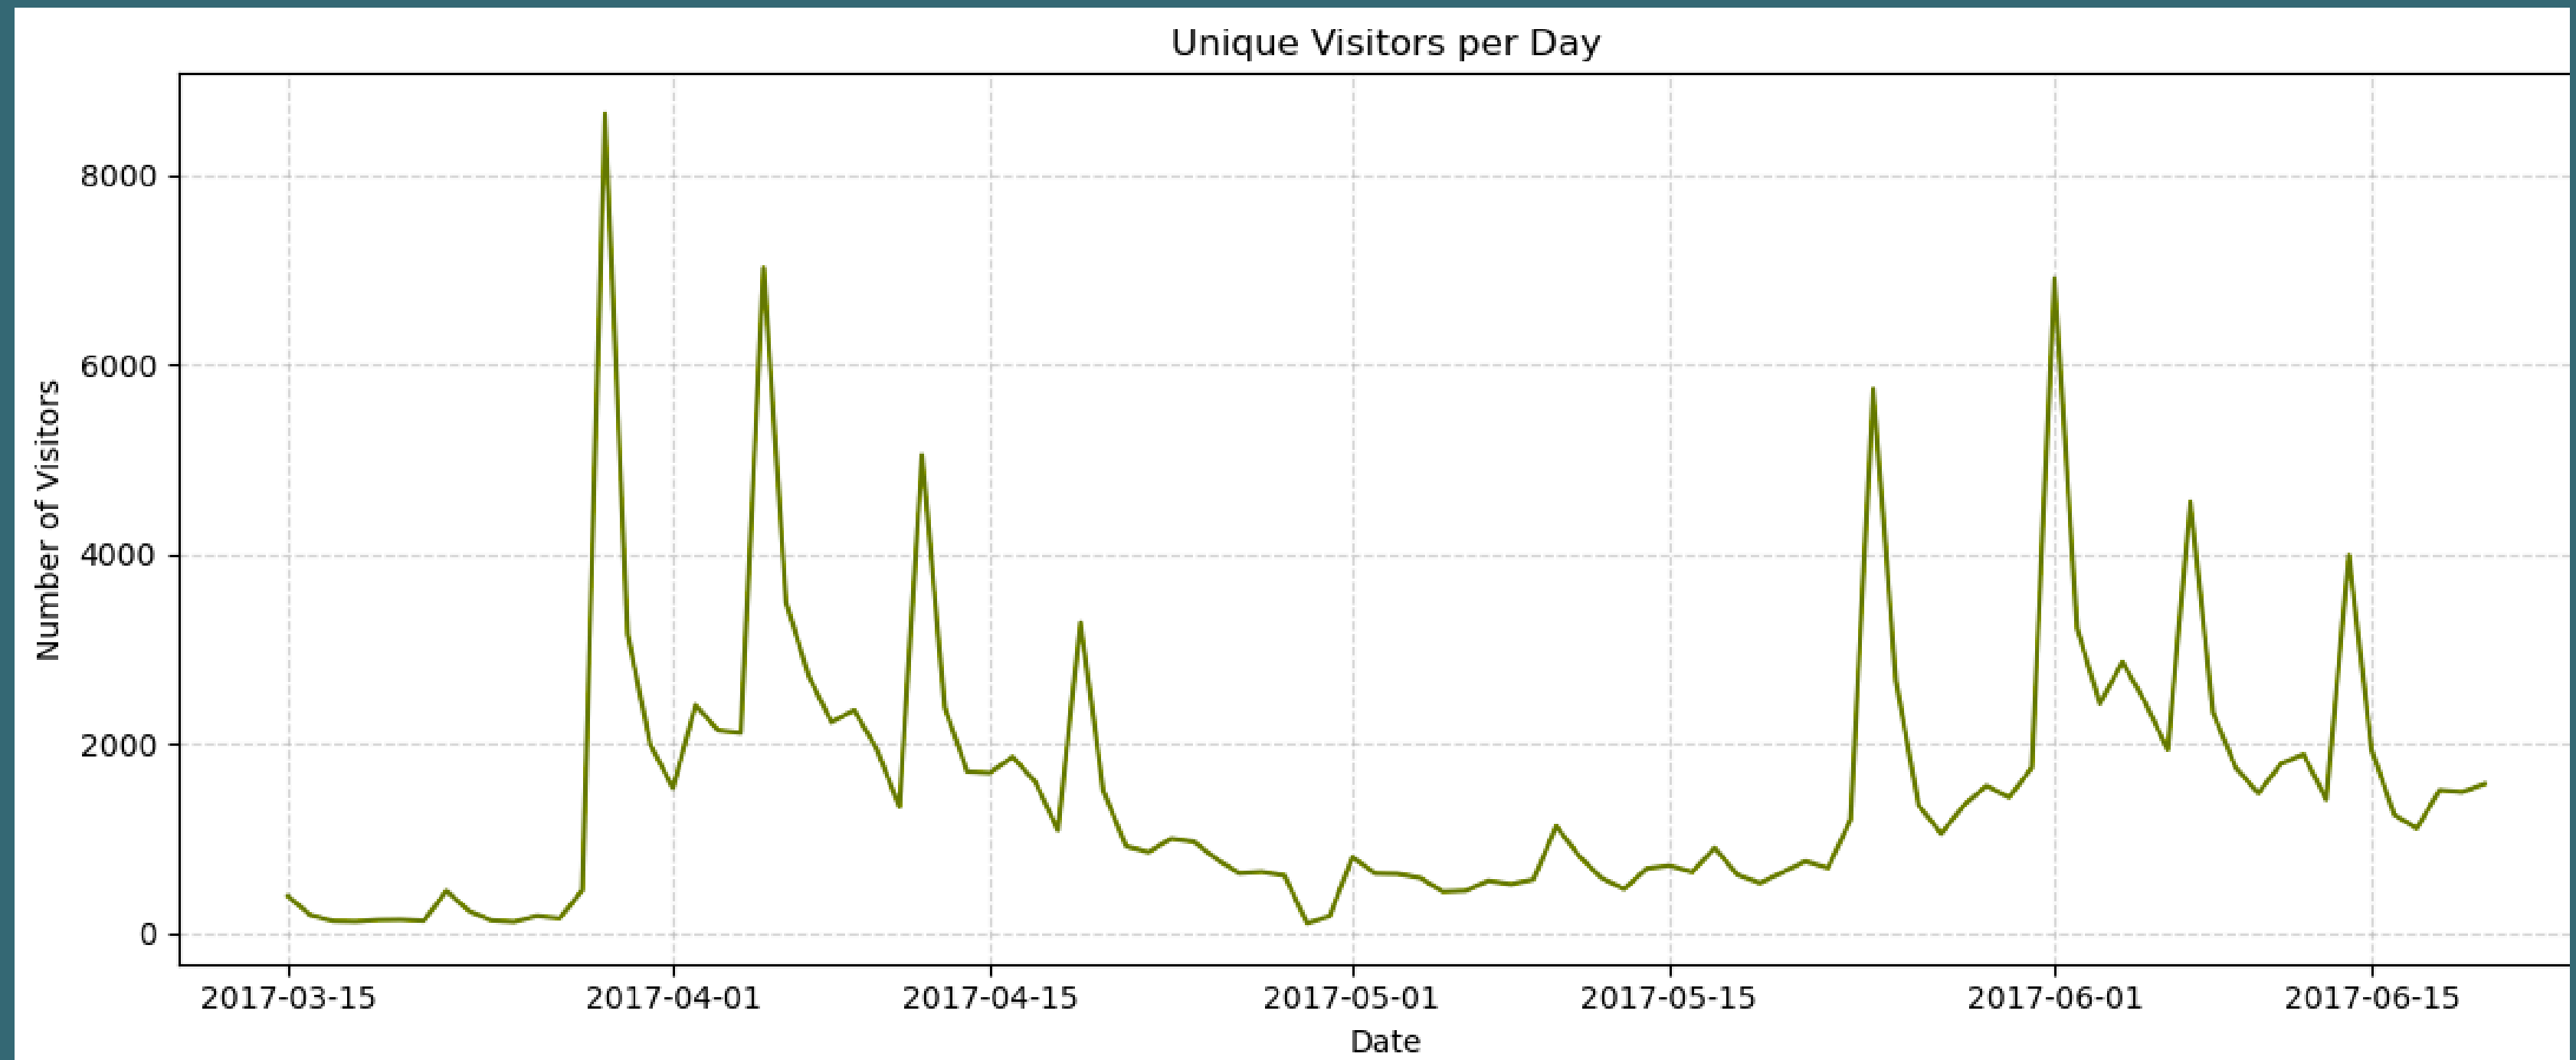

- Experiment could have been improved. Since $\frac{1}{3}$ data is unclear if it's control or test group, it's hard to come to clear conclusions.
- It would be good to add feedback rating, it would give us better insight into subjective experience of users.
- This new design does increase rate of completing the process.

VARIATION	COUNTS
TEST	18687
CONTROL	15434
UNKNOWN	13679

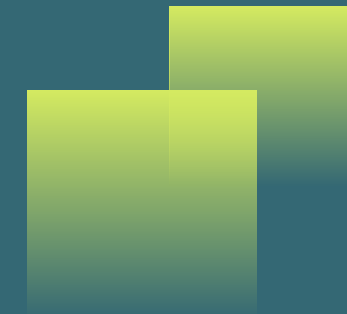

Course of 3 months Trial, suggestion to prolonge it over 12 months.

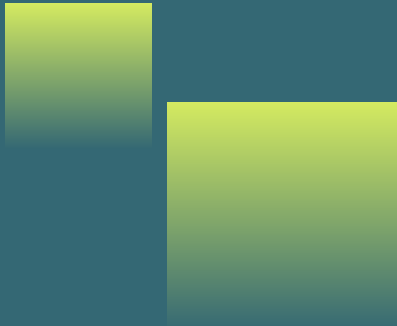

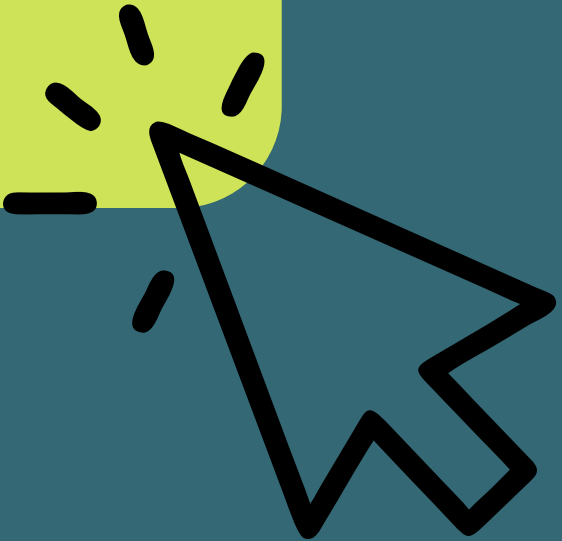

CONCLUSION AND RECOMMENDATION

- For trial of 3 months there was no particular cost efficiency
-> It would be good that trial was done over the course of at least 12 months
- Even though new design doesn't have significant impact for cost efficiency, new design likely improves clients completion behaviour.
- People repeat mostly start step and also, most participants gives up on this step, which can insinuate error's!
At the step two is the most time spent!
-> It should be considered to improve the system by checking for errors, making it more user friendly and adding feedback rating
